Asphalt Plants

Asphalt Plants use our Pyro wrap to conserve energy in the manufacturing process. Asphalt is created with hot oil running through a double wall pipe. The hot oil runs through the inner pipe and the tar and gravel is pumped through the outer pipe. Pyro Shield manufactures removable insulation covers for piping, valves, and flange to flange connections. The covers are made of 100% fiberglass to handle the temperature and have an external silicone rubber to prevent weather damage. The Pyro wrap holds the

insulation on the piping to prevent heat loss and can be taken off and re-installed easily.
